

Raju – anonymous (12) is suffering with Duchene Muscular Dystrophy (DMD), a rare disease, as with growing age, muscles get weaker and weaker. In the process, DMD also affects orofacial muscles due to which there is an incorrect relationship between the teeth of the upper and lower dental arches leading to difficulty chewing, swallowing, and breathing with an open mouth, affecting sleep.

To rectify Raju's rare dental situation, we luckily found 'Duchene Smiles, Specialty Dental Centre.' Dr. Azher Mohiuddin and Dr. Taha Siddiqui carefully understood the problem and analyzed the health condition of Raju and gone through various international publications on his condition and suggested to treat Raju with "INVISALIGN" which is a painless and sophisticated treatment for correcting dental arch.

Raju is halfway through the "INVISALIGN" treatment now and has shown great results. Currently, Raju has improved chewing, swallowing, and is breathing normally, and sleep well. Even though "INVISALIGN" is expensive when compared to braces, it is value for money.

We thank Dr. Taha Siddiqui and Duchene Smiles Dental Center for their deep involvement in improving Raju's rare condition.

Surprisingly, Guillaume Benjamin Amand Duchenne is the man behind the coining of the terms "Duchene Muscular Dystrophy" and "Duchene Smiles," which is a rare coincidence happened to Raju.

The research will be continuing for another 6 months and then the findings will be published as a journal.

Thanks, and Regards  
Team, Rare Helix
